

HD44105

(Dot Matrix Liquid Crystal Graphic Display
Common Driver)

HITACHI

Description

The HD44105 is a common signal driver for LCD dot matrix graphic display systems. It generates the timing signals required for display with its internal oscillator and supplies them to the column driver (HD44102) to control display, also automatically scanning the common signals of the liquid crystal according to the display duty cycle.

It can select 7 types of display duty cycle 1/8, 1/12, 1/16, 1/24, 1/32, 1/48, and 1/64. It provides 32 driver output lines and the impedance is low (1 k Ω max) enough to drive a large screen.

Features

- Dot matrix graphic display common driver including the timing generation circuit
- Internal oscillator (oscillation frequency is selectable by attaching an oscillation resistor and an oscillation capacitor)
- Generates display timing signals
- 32-bit bidirectional shift register for generating common signals
- 32 liquid crystal driver circuits with low impedance
- Selectable display duty ratio: 1/8, 1/12, 1/16, 1/24, 1/32, 1/48, 1/64
- Low power dissipation
- Power supplies:
 - $V_{CC} = +5\text{ V} \pm 10\%$
 - $V_{EE} = 0\text{ to }-5.5\text{ V}$
- CMOS process

Block Functions

Oscillator

The oscillator is a CR oscillator attached to an oscillation resistor R_f and an oscillation capacity C_f . The oscillation frequency varies with the values of R_f and C_f and the mounting conditions. Refer to electrical characteristics (note 10) to make proper adjustment.

Timing Generation Circuit

This circuit divides the signals from the oscillator and generates display timing signals (M, CL, and FRM) and operating clock ($\phi 1$ and $\phi 2$) for HD44102 according to the display duty ratio set by DS1 to DS3. In the slave mode, this block stops operating. It is meaningless to set FS1, FS2 and DS1 to DS3. However, connect them to V_{CC} to prevent floating current.

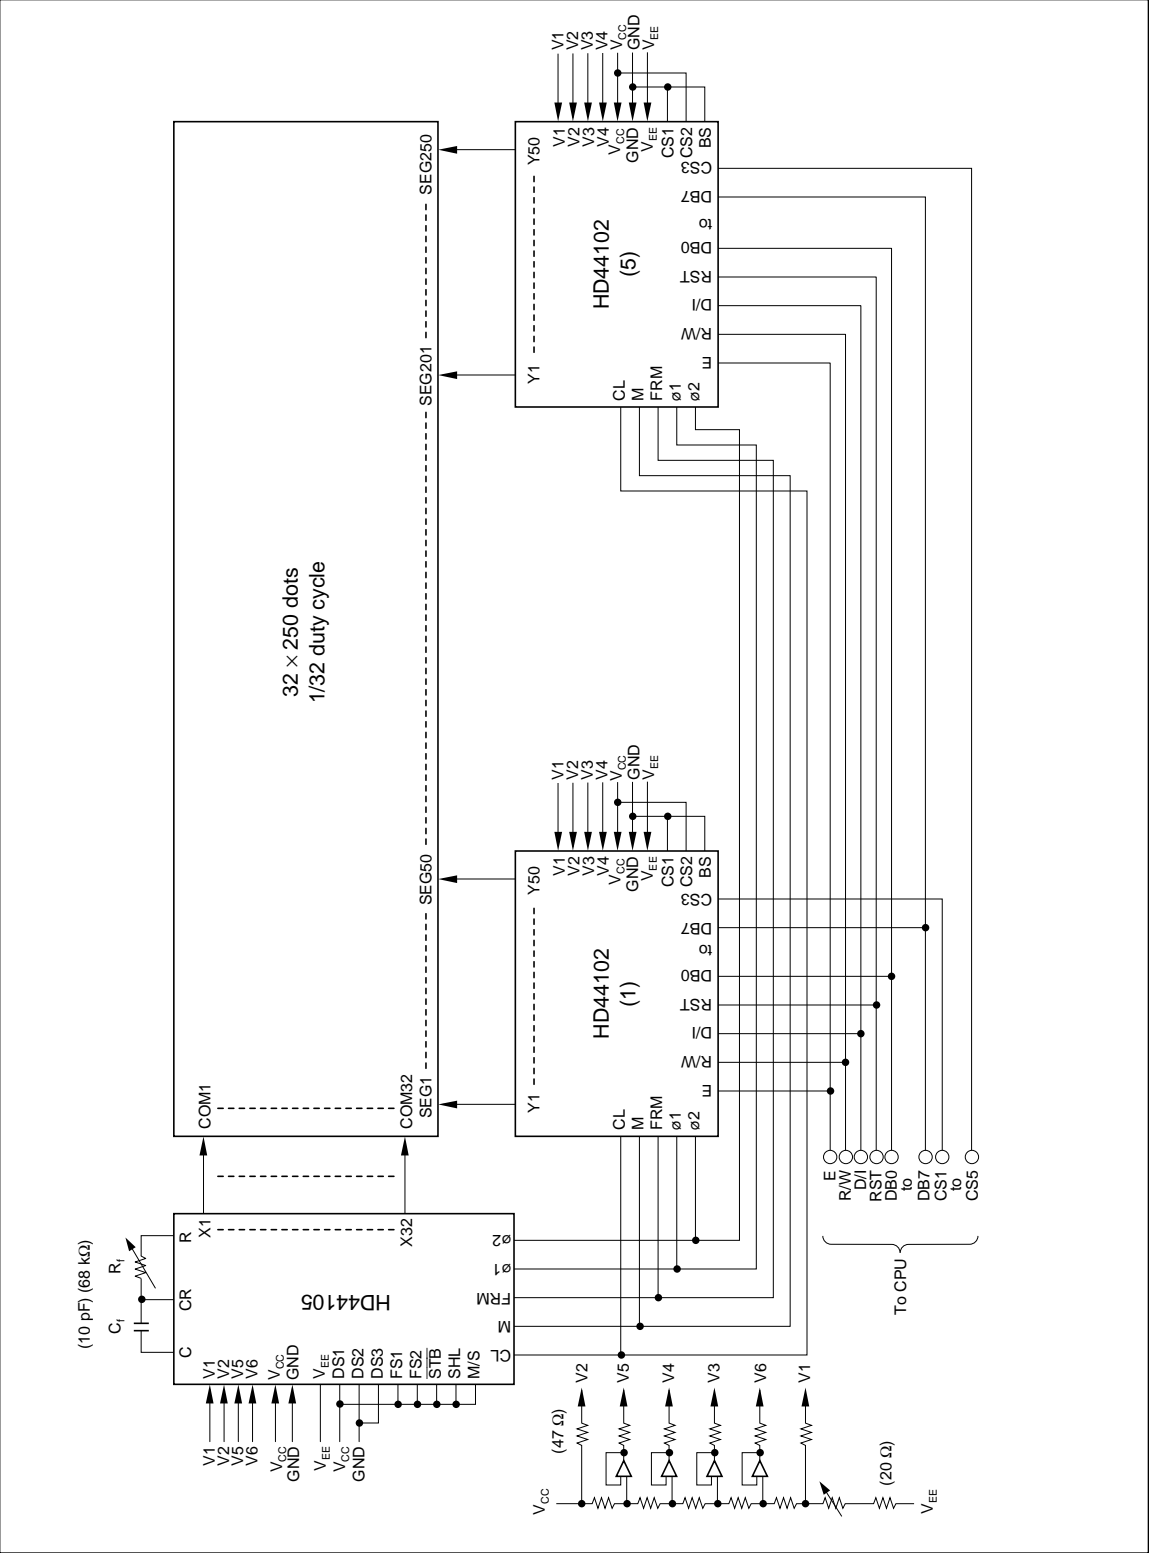

Bidirectional Shift Register

A 32-bit bidirectional shift register. The shift direction is determined by the SHL. The data input from DL or DR performs a shift operation at the rise of shift clock CL.

Liquid Crystal Display Driver Circuit

Each of 32 driver circuits is a multiplex circuit composed of four CMOS switches. The combination of the data from the shift register with the M signal allows one of the four liquid crystal display driver levels V1, V2, V5, and V6 to be transferred to the output terminals.

10. Relation between oscillation frequency and R_f , C_f .

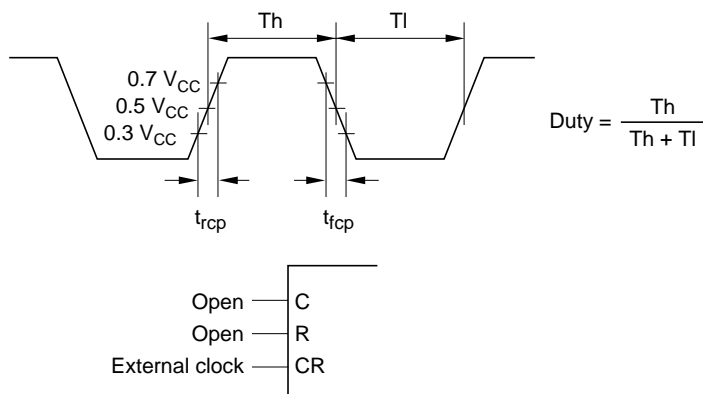

Connection

The values of R_f and C_f are typical values.
The oscillation frequency varies with the mounting condition. Adjust oscillation frequency to a required value.

11.

12. Measured by V_{CC} terminal at output non-load of $R_f = 68 \text{ k}\Omega \pm 2\%$ and $C_f = 10 \text{ pF} \pm 5\%$, and 1/32 duty cycle in the master mode.

Input terminals are connected to V_{CC} or GND.

13. Measured by V_{CC} terminal at output non-load, 1/32 duty cycle, and frame frequency of 70 Hz in the slave mode.

Input terminals are connected to V_{CC} or GND.
